

Supervised Learning Practical

Supervised Practical 1

Suppose we have a data set consisting of house sales data.

For each purchase, we would have the

- price that was paid,
- size of the house in square meters, and
- number of bedrooms,
- the year of construction,
- Etc.

If you want to predicts the selling price of houses based on these features

- What model type would you choose?
- Why?
- What would the independent variable(s) (features) and the dependent variable (predicted value) be.?

Supervised Practical 2

Suppose we have a data set consisting of flower (Iris) data.

Each record contains

- sepal length,
- sepal width,
- petal length,
- petal width, and
- species

If you want to predicts the species of the flower based on these features

- What model type would you choose?
- Why?
- What would the independent variable(s) (features) and the dependent variable (predicted value) be.?
